Solutions to Differential Equations Exercises

It is the same concept when solving differential equations - find general solution first, then substitute given numbers to find particular solutions. Let's see some examples of first order, first degree DEs. Example 4, a. Find the general solution for the differential equation $y' + 7x dx = 0$. b. Find the particular solution given that $y(0)=3$.

In this section we solve separable first order differential equations, i.e. differential equations in the form $N(y) y' = M(x)$. We will give a derivation of the solution process to this type of differential equation. We'll also start looking at finding the interval of validity for the solution to a differential equation.

Differential Equations. Here are a set of practice problems for the Differential Equations notes. Click on the "Solution" link for each problem to go to the page containing the solution. Note that some sections will have more problems than others and some will have more or less of a variety of problems.

Differential Equations (Practice Problems)

A first-order differential equation is defined by an equation: $dy/dx = f(x,y)$ of two variables x and y with its function $f(x,y)$ defined on a region in the xy -plane. It has only the first derivative dy/dx so that the equation is of the first order and no higher-order derivatives exist. The differential equation in first-order can also be written as:
