Mutations happen for several reasons. DNA fails to copy accurately Most of the mutations that we think matter to evolution are "naturally-occurring." For example, when a cell divides, it makes a copy of its DNA — and sometimes the copy is not quite perfect. That small difference from the original DNA sequence is a mutation.

Evolutionists believe mutations can gradually change an organism from one kind to another, as natural selection favors the mutations that are beneficial. For a beetle living on a wind-swept island, a mutation that causes the loss of wings could help prevent it from being caught in a gust of wind and carried out to sea.
