PCD tools are especially effective at machining multi-directional and uni-directional composites, materials that are growing in use in the aerospace sector. An example is Sandvik Coromant's PCD-veined cutting tools for drills, mills and end mills.

The Composite Challenge | Cutting Tools | Machining Technology

Composite materials take the place of many metal parts of an aircraft. At first glance, they are machined through a similar process: cutting the desired part out of a larger block of material. However, machining composites is an exacting science that demands a specific set of skills and tools.

Machining of Composite Materials - Hess Aerospace

Machining of composites may look like machining metal, but that appearance is deceiving. Parts made of a composite material such as the carbon fiber reinforced plastic (CFRP) increasingly being used for aircraft components can be set up and run on the same machine tools as metal parts.

Composite Machining for decades, the aircraft industry has utilized composite materials in multiple applications, including flight surfaces and some internal cabin parts.

Aerospace — Composite Machining Guide

The preferred tool material for composites and especially carbon fiber is polycrystalline diamond (PCD). Given how hard diamond is, these tools can stand up to the abrasive nature of the composite machining process much better than plain carbide tooling. A good PCD tool can run 3x faster in composites and last as much as 25x longer than carbide.

H.A. Kishawy, in Machining Technology for Composite Materials, 2012. Abstract: Metal matrix composite materials (MMCs) offer various mechanical properties that are not offered by conventional unreinforced monolithic metal counterparts; specifically, high temperature stability, specific strength, and wear resistance. As a result, these composite materials have different applications in several industries including automotive and aerospace.

Tool materials for machining composites vary significantly, depending on the application (trimming, drilling or surface finishing) and whether it is a roughing tool or a finishing tool. The baseline tool material is carbide, followed by coated carbide.

Machining carbon composites: Risky business | CompositesWorld

Machining composite materials is quite a complex task owing to its heterogeneity, and to the fact that reinforcements are extremely abrasive. In modern engineering, high demands are placed on components made of composites in relation to their dimensional precision as well as their surface quality.
